

XX.—LIST OF FISHES COLLECTED AT WOOD'S HOLE.

By S. F. BAIRD.

All the species of fishes in the following list (121 in number) were collected by the United States Commission during the season of 1871, with the exception of a few taken there the following year by Vina N. Edwards, and of *Lactophrys trigonus* and *Hippocampus hudsonius*, given by Dr. Storer as taken at Holme's Hole, or Vineyard Haven. A complete collection was secured for the National Museum, together with many duplicates for distribution to college and other museums throughout the country, and for exchange. Of all taken in 1871, photographs were made on plates, 11×14 inches, representing the fishes either of life size or as reduced to within the above dimensions, and in their different ages and varieties, thus showing the rate of growth, and other facts.

At some future time I hope to present detailed biographies and descriptions of all the species, with suitable figures.
