

## REPORT ON THE PROPAGATION AND DISTRIBUTION OF FOOD FISHES.

---

By JOHN W. TITCOMB, *Assistant in Charge.*

---

The division of fish culture is charged with the artificial propagation of fishes, the rescue of fishes from overflowed lands of the Mississippi and Illinois rivers, the distribution of fish and eggs, and the stocking of public and private waters with suitable food and game fishes.

The demand for fish is now greater than ever before. The number of applications received during 1903 was 4,315—an increase of 13 per cent over 1902 and of 41 per cent over 1901. A large proportion of these applications was from anglers or sportsmen, and called for such fishes as the basses, trouts, and salmons. The total output of the hatcheries was 1,226,057,457 fish and eggs, of which 14,381,866 were the species commonly classed as game, while 1,211,675,609 were those species which enter into the commercial fisheries of the country.

While the same general methods of fish culture have been followed as heretofore, a few changes have been made in the handling of certain fishes. Thus at the various stations where bass are propagated, where heretofore all the fish have been reared for fall distribution as fingerlings, a large number of fish this season were distributed as "baby fingerlings." This term has been applied by fish culturists to fish 1 to 3 inches long taken from the ponds in May, June, and July. It has been found that there is such a difference in the size of the fish in the early and late broods that some measures are necessary for the disposition of the fish last hatched in order to prevent their destruction by the larger fish. In connection with the stripping and fertilizing of the eggs of the Pacific salmons, the normal salt solution has been more extensively used than heretofore; and some experiments at the Clackamas station have tended to indicate that a larger percentage of eggs can be fertilized by cutting the fish open, removing all the eggs, and washing them in the salt solution, than by the usual method of stripping.

At some of the stations it has been found that eggs can at times be purchased from private fish culturists at less expense than they can be collected from wild fish. In purchasing, care is taken to secure eggs of fish not less than two and one-half years old, it having been proved

that the eggs from the second year's stripping are preferable to those of younger fish. For a comparison of methods, during the past year the eggs from six private hatcheries were placed side by side in troughs at the various stations and incubated under similar conditions of water supply. It was found that there is a great difference in the quality of eggs received from different hatcheries, undoubtedly due to the condition of the parent fish, which at some stations may be crowded and overfed. Where extensive purchases of eggs are made the cost of transportation is an item for consideration, and in this connection it is noted that the nature of the material in which the eggs are packed has much to do with the cost of transportation. Where dried forest leaves are used the cost of shipment is about one-half the cost when sawdust is used. Dried leaves are the most desirable packing, but of the other materials used dried moss or shavings are preferable to sawdust.

As a result of special efforts to extend the work of propagating the Atlantic salmon, the output was nearly three times as great as in the previous year, and a larger number than usual was reared as fingerlings and yearlings.

The shad season was fairly successful, and 156,873,000 eggs were secured. Early in March the weather was unusually warm, causing the water temperature to rise, and attracting the shad to the rivers. At the Edenton, N. C., station, about the average collections were obtained, but at the station on the Potomac River the take of eggs was larger than ever before. A cold wave in April greatly retarded and interfered with operations on the Susquehanna and Delaware rivers, and the results at those stations were much less than had been anticipated.

The collection of lake trout eggs at the Great Lakes stations was the largest in the history of the Commission, the results being especially good on Lake Michigan, where a new station was established at Charlevoix. The egg collections amounted to 51,841,000, most of the eggs being taken during the closed season by means of tugs hired to secure the ripe fish, and the fry hatched from them were planted on the spawning grounds. Preparations were made for penning white-fish on an extended scale, but owing to warm weather during the spawning season the collections fell somewhat behind those of the previous year. The total number of eggs taken was 409,384,000, secured from the penned fish and from commercial fishermen operating in the various fields on Lake Erie and the Detroit River. Of these the state fish commissions were given 63,052,000; the remainder were hatched and the fry liberated in the waters from which the parent fish were obtained.

As in the past, the principal work of the Commission on the Pacific coast during the year has been the propagation of the quinnat salmon, operations being conducted at 11 stations located in California, Oregon,

and Washington, and resulting in the collection of 47,079,000 eggs, of which 13,142,000 were furnished to state fish commissions. The prospects for work were very bright early in the year, the run of fish being unusually large and necessitating the installation of extra racks at some points, but owing to high water during the spawning period many of the fish escaped over the racks, and in some of the rivers the dams and buildings were carried away, thus putting an end to what had promised a very profitable season. Fry and fingerlings of other species of salmon to the number of 4,730,000 were produced for distribution at these stations. Eggs of the white-fish, lake trout, brook trout, rainbow trout, black-spotted trout, and landlocked salmon were sent to the Clackamas station to be hatched, with a view to stocking the waters of the Pacific coast states, thereby saving the expense of transporting fish of these species from eastern stations.

The unseasonably warm weather in March and a sudden lowering of the temperature early in April caused a falling off in the pike perch work on Lake Erie, the total collection of eggs for the Put-in-Bay station amounting to 325,675,000, or over a hundred million less than in 1902. While they were still in the green stage, 70,000,000 eggs were shipped to various state commissions; the remainder were hatched and planted on the spawning grounds in Lake Erie. The pike perch work at Swanton, Vt., was also affected by the unfavorable weather, and though it had been planned to operate on a larger scale than in the past, the results at this point were smaller than ever before, only 50,000,000 eggs being secured. About 10,000,000 of these were furnished to state commissions and the fry hatched from the remaining eggs were distributed in the waters of Vermont and surrounding states.

Owing to scarcity of brood fish and other causes, the cod work at the Massachusetts stations was unusually light, only 152,582,000 eggs being secured at all points. On the other hand, the conditions governing the flatfish work were very favorable, and 328,060,000 eggs were taken and hatched with the usual small percentage of loss, the fry being distributed on the spawning grounds along the Massachusetts coast. At the Woods Hole station the cultivation of mackerel, sea bass, scup, and tautog has been resumed, and will be pushed as actively as practicable. There was a decided falling off in the lobster work, the stormy weather interfering greatly with the work in Maine, while nearly all of the fishing centers in Massachusetts showed a decreased catch. The 74,623,000 eggs obtained were hatched and the fry planted on the fishing grounds along the coast from Maine to Connecticut.

One of the best of the small river fishes is the yellow perch, which has become comparatively scarce in some localities on account of extensive fishing and absence of protection. The cultivation of the species is demanded, especially on the Potomac River, and has been taken up at several stations incidentally to other work. The output in 1903 was

about 30,000,000, and it is expected that much larger results will be obtained hereafter.

An equally important and excellent fish is the white perch, whose cultivation has now become desirable and was first conducted on a large scale in 1903. In connection with the propagation of shad on Susquehanna River, upward of 30,000,000 white perch fry were hatched and planted.

It would appear that regular operations addressed to the propagation of the striped bass may be practicable on Roanoke River, and that large numbers of this highly esteemed food and game fish may hereafter be produced. Experimental work at Weldon, on that stream, in the spring of 1903, resulted in the hatching of upward of 3,000,000 fry, and indicated that this is probably the best site on the coast for collecting the eggs of this species, which up to this time has received very little attention from the Commission.

#### SOME RESULTS OF FISH CULTURE.

During the year, 242 letters were addressed to applicants who had received fish in 1899, inquiring as to the results of the plants. Of the 129 replies received, 86 showed that waters had been successfully stocked, 20 indicated failure, and 23 gave indefinite information. Investigation of the cases where failure occurred indicated that the waters were unsuited to the fish applied for. It has therefore been found very desirable to obtain from applicants more detailed and accurate information than has heretofore been asked for in regard to the waters to be stocked, and new blanks have been prepared with this in view. When the description of the waters to be stocked indicates that the fish for which an applicant has expressed a preference is well suited to them, it is customary to furnish the kind desired, but the Commission reserves the right to determine this point and to prescribe the proper species.

From correspondents in various parts of the country who have volunteered information and from others who have been asked to report the outcome of attempts to stock waters in which they were interested, the following data, showing some recent results of fish culture and fish acclimatization, have been obtained:

#### TROUT IN COLORADO, SOUTH DAKOTA, AND MONTANA.

Brook trout, rainbow trout, Scotch lake trout, and steelhead trout are now firmly established in Colorado, none of them being indigenous. The brook trout affords better fishing than the native black-spotted trout, and more eggs of the brook trout can be collected in Colorado than in any other State, where hatcheries are located, to which the species is native. In the Black Hills of South Dakota and adjacent country, where there were no brook trout twenty years ago, all of the before-named trouts are now caught. Very favorable reports have also come from Montana in regard to these and other fishes introduced in the waters of that State.

## STEELHEAD TROUT IN THE GREAT LAKES REGION.

The steelhead trout, introduced into the tributaries of Lake Superior, was in evidence in greater numbers last spring during the spawning season than ever before. The fish ascended the Lester River as far as the dam near Duluth station, passing over all the falls below this dam, and could be seen jumping at almost any time of day from about the 20th of April to the 30th of May. From 150 to 200 large steelheads were caught by fishermen (worms being used as bait) on Lester River between the railroad bridge and the Fish Commission dam, a distance of 300 to 400 yards, all of them being males but three or four, and weighing from 1½ to 4½ pounds. The females refused to take the hook during the spawning season. These fish are frequently caught in the nets of the commercial fishermen along the north shore.

Under date of June 26, 1903, L. E. Baldridge, of the Duluth hatchery, reported that one year ago a plant of steelheads was made in Baker Lake, near Spooner, Wis., and that in June a specimen was brought to the station from that lake which weighed half a pound and was 11 inches long.

A report from Traverse City, Mich., states that many fish locally called rainbow trout, but which were undoubtedly steelheads, have been caught in the streams below Hoxie's Pond, near Acme; mention was made of one specimen 30 inches in length and weighing fully 12 pounds.

## LANDLOCKED SALMON AND TROUT IN CALIFORNIA.

Mr. Charles A. Vogelsang, chief deputy of the California fish commission, reports as follows: The consignment of 25,000 landlocked salmon furnished in 1899 arrived in rather poor condition, and the results were not as satisfactory as could be wished. About 17,000 of the fry were planted in Lake Tahoe, where occasional specimens are taken; 1,000 fry were placed in a lake in Placer County, near Cisco, in the Sierra Nevada Mountains, and two or three specimens have been taken this year, the largest weighing about 4 pounds. It was the impression of the superintendent who hatched the eggs that the loss was unusually heavy, and the surviving fry were not strong, but enough has been done to demonstrate that under favorable conditions these fish will flourish in our mountain lakes. Loch Leven and German brown trout, the eggs of which were furnished by the United States Fish Commission, have produced good results. They were planted principally in lakes, but some of the brown trout were placed in streams. A previous State board decided that they were destructive to other forms of trout life, and discontinued their further propagation. In Donner Lake, Loch Levens weighing 4 or 5 pounds are taken. Mackinaw trout (*Cristivomer namaycush*), hatched from eggs furnished by the United States Fish Commission, were planted in Lake Tahoe, and have done better than any other of the fishes introduced in those waters.

## STRIPED BASS AND SHAD IN CALIFORNIA.

Regarding these fish Mr. Vogelsang writes: The history of our striped bass propagation is so well known that we will simply refer to it briefly by saying that 100 small fish planted in 1879, and 350 in 1882, in the Straits of Carquinez, have developed so that we are marketing in this city about 2,000,000 pounds annually. They are frequently found weighing from 35 to 40 pounds, and a number of specimens have been brought in that reached 50 pounds. These fish were not known to the waters of the Pacific until introduced through the agency of the United States Fish Commission. Shad have increased so enormously that the principal dealers restrict the catch, and they are sometimes sold for 25 cents per box of about 75 pounds.

## RAINBOW TROUT IN NORTH CAROLINA.

The Toxaway Company, writing about the stocking of Fairfield Lake with rainbow trout in 1899, states that in 1902 and 1903 fish were taken from the lake weighing  $4\frac{1}{2}$  and  $4\frac{3}{4}$  pounds. The water seems especially well adapted to these fish; they grow rapidly and are excellent from every standpoint—gamy, full of life, and good table fish.

## RAINBOW TROUT IN PENNSYLVANIA.

Mr. E. H. Ashcraft, of the Coudersport Rod and Gun Club, reports that rainbow trout are doing nicely in streams that were originally filled with speckled trout. In the spring of 1903 one was caught which was 22 inches long and weighed  $5\frac{1}{2}$  pounds. In 1899 he stocked two ponds, one being the reservoir supplying Coudersport, and has been able to keep watch on the fish. They have grown well and in 1903 weighed 2 to  $2\frac{1}{2}$  pounds, and have been multiplying so that there have been two runs of young fish from the reservoir into the main stream supplying it. The large fish will be transferred to a new pond that is being built.

## BLACK BASS AND CRAPPIE IN NEW JERSEY, PENNSYLVANIA, AND MASSACHUSETTS.

A correspondent at Burlington writes: The black bass sent to me have done splendidly. Our state prohibits fishing in stocked waters for a period of three years, so you can see they have had a good chance. The first day after the three years expired there were over 100 fish caught, some weighing more than 5 pounds. The fishermen were greatly surprised to see that they had done so well.

An applicant for crappie for Lake Popanomining, Pennsylvania, states that the fish spawned and multiplied, and that recently as many as 90, each weighing 1 pound or thereabouts, were taken by a single rod during some of the best days of the season. The fish he received were divided into two lots, one part going to Cranberry Lake, New Jersey, where they have done equally well. From some others, placed in Lake Hopatcong, no reports have yet been received.

The Connecticut River between the Holyoke dam and Turners Falls was stocked with black bass in 1898, 1899, and 1900, each consignment consisting of 200 to 300 fish. The river at Holyoke is more than 1,000 feet wide, and the distance between the two points named is about 30 miles. Most of the illegal fishing in this stretch of the river has been stopped, and it is reported that there has been a decided increase in the number of black bass from that time.

## SPOTTED CAT-FISH IN POTOMAC RIVER.

The Potomac River between Great Falls and Alexandria has been very successfully stocked with spotted cat-fish from the Mississippi River, and at present this species is one of the most desirable fishes caught by anglers. The largest specimens reported from the Potomac have weighed upward of 20 pounds. The average weight of those taken with hook and line is about  $2\frac{1}{2}$  to 3 pounds, and many weigh 4 to 12 pounds. This is regarded as an excellent game species.

## OPERATIONS OF THE STATIONS.

The stations and substations at which fish-cultural operations were conducted in 1903, with the persons in charge, were as follows, the permanent hatcheries being indicated thus \* and the subsidiary stations being shown thereunder:

Name of station.	In charge.
* Green Lake, Me.	E. E. Race, superintendent.
* Craig Brook, Me.	Charles G. Atkins, superintendent.
Grand Lake Stream, Me.	Do.
* Nashua, N. H.	W. F. Hubbard, superintendent.
* St. Johnsbury, Vt.	E. N. Carter, superintendent.
Swanton, Vt.	Do.
* Gloucester, Mass.	C. G. Corliss, superintendent.
* Woods Hole, Mass.	E. F. Locke, superintendent.
* Cape Vincent, N. Y.	Livingston Stone, superintendent.
Steamer Fish Hawk (Delaware River)	James A. Smith, commanding.
* Batterymd.	George H. H. Moore, superintendent.
* Bryans Point, Md.	L. G. Harron, superintendent.
* Fish Lakes, D. C.	C. K. Green, superintendent.
* Wytheville, Va.	George A. Seagle, superintendent.
* White Sulphur Springs, W. Va.	Robert K. Robinson, superintendent.
* Erwin, Tenn.	Alexander Jones, superintendent.
* Cold Springs, Ga.	J. J. Stranahan, superintendent.
* Edenton, N. C.	S. G. Worth, superintendent.
Weldon, N. C.	Do.
* Put-in-Bay, Ohio.	S. W. Downing, superintendent.
* Northville, Mich.	Frank N. Clark, superintendent.
Detroit, Mich.	Do.
Sault Ste. Marie, Mich.	Do.
Charlevoix, Mich.	Do.
Alpena, Mich.	Do.
* Quincy, Ill.	S. P. Bartlett, superintendent.
* Manchester, Iowa	R. S. Johnson, superintendent.
Bellevue, Iowa	Do.
* Neosho, Mo.	H. D. Dean, superintendent.
* San Marcos, Tex.	J. L. Leahy, superintendent.
* Leadville, Colo.	E. A. Tullian, superintendent.
* Spearfish, S. D.	D. C. Booth, superintendent.
* Bozeman, Mont.	J. A. Henshall, superintendent.
* Baird, Cal.	H. G. Lambson, superintendent.
Mill Creek, Cal.	Do.
* Clackamas, Oreg.	J. N. Wigner, superintendent.
Little White Salmon, Oreg.	Claudius Wallich.
Big White Salmon, Oreg.	George H. Tolbert.
Eagle and Tanner creeks, Oreg.	E. C. Greenman.
Rogue River, Wash.	John W. Berrian.
* Baker Lake, Wash.	Henry O'Malley, superintendent.
Birdsvile, Wash.	Do.

The output of the individual stations is shown in the following table; the figures in the notes are to be taken in addition to the regular figures in determining the operations of each hatchery:

*Fish and eggs furnished for distribution by stations of the U. S. Commission of Fish and Fisheries during the fiscal year ending June 30, 1903.*

Source of supply.	Species.	Eggs.	Fry.	Fingerlings, yearlings, and adults.
Green Lake, Me. <sup>a</sup>	Brook trout.	355,000	880,000	115,137
Craig Brook, Me. <sup>b</sup>	Landlocked salmon.	126,000	5,682	258,806
	Steelhead trout.			933
	Scotch sea trout.	2,500		199
	Lake trout.		40,646	
	Grayling.		17,114	12
	Atlantic salmon.		1,632,273	304,016
	Landlocked salmon.	65,000	196,132	61,709
	Brook trout.	35,000	476,000	58,835
	Rainbow trout.			107,599
	Lake trout.		171,695	5,640
	Golden trout.		16,825	9,100
	Grayling.		30,000	4,200
	Hybrid trout.			1,720
	Landlocked salmon.			17,800
	Brook trout.	176,000	900,350	5,650
	Rainbow trout.			2,574
	Steelhead trout.		19,860	35,240
	Lake trout.		178,000	836
	Grayling.			636
	Canadian red trout.			14,473
	Landlocked salmon.			

<sup>a</sup> Transferred to Craig Brook Station 125,000 brook-trout fry, and to other stations of the U. S. Fish Commission 60,000 landlocked-salmon eggs.

<sup>b</sup> Transferred to other stations 60,000 landlocked-salmon eggs.

<sup>c</sup> Transferred to other stations 19,000 brook-trout eggs, and to Nashua Station 165,000 brook-trout fry and 130 Canadian red trout.

*Fish and eggs furnished for distribution, etc.—Continued.*
